

ASSIGNMENT 3- A simple RESTFUL API using React.js, DataBase Creation, and Creating Index

Name: Mahalakshmi Vasanthi Nakka

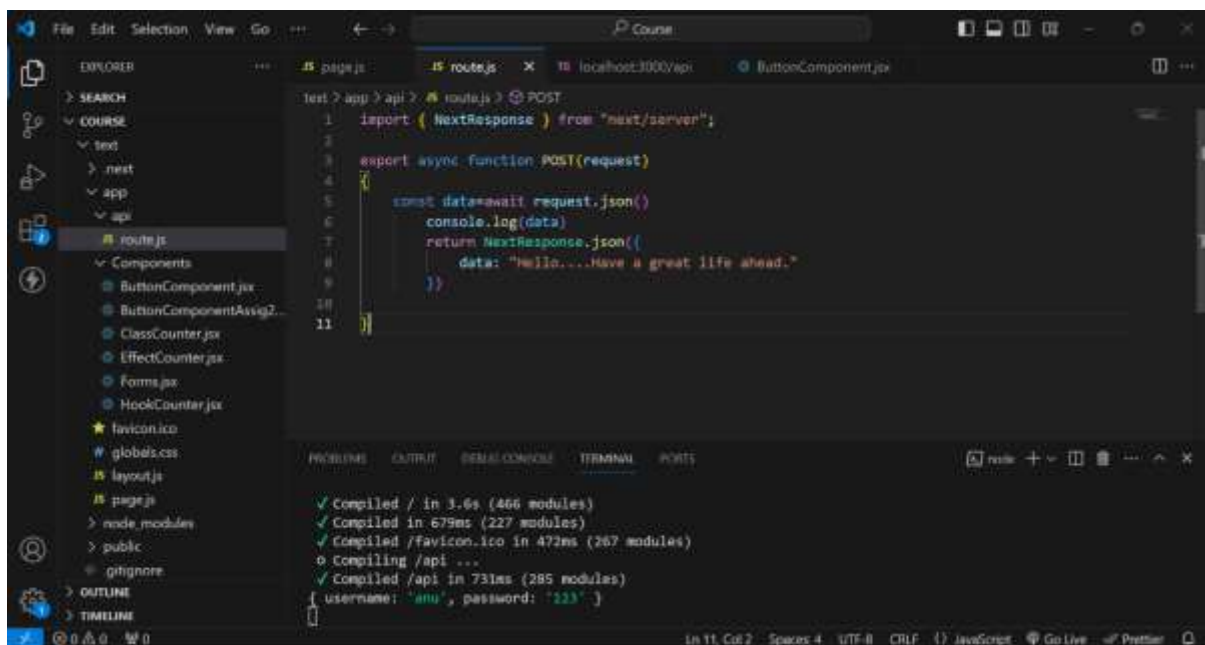

Email: mahalakshmivasanthinakka@gmail.com

Roll NO: 20NN1A05F5

College Name: Vignan's Nirula Institute of Technology and Science For women

University: JNTUK

RestFul API code

The screenshot shows a VS Code editor with a project named 'Course'. The file explorer on the left shows the project structure, including 'route.js'. The main editor displays the code for a POST endpoint in 'route.js':

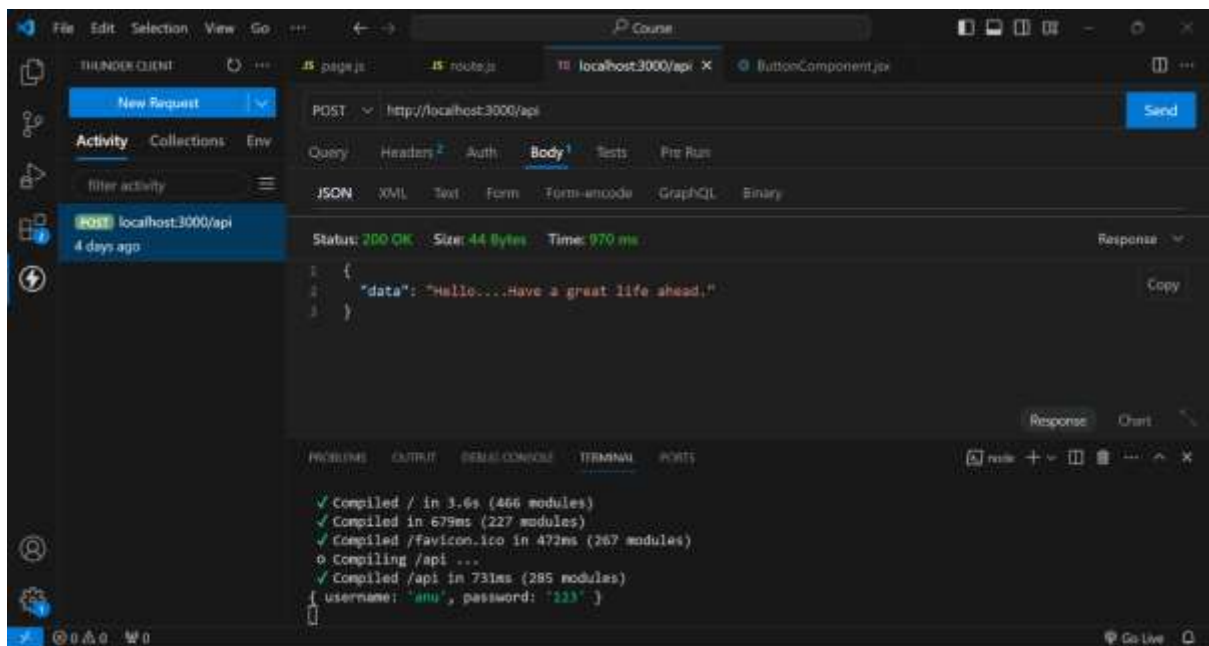

```
1 import { NextResponse } from 'next/server';
2
3 export async function POST(request)
4 {
5   const data = await request.json();
6   console.log(data);
7   return NextResponse.json({
8     data: "Hello....Have a great life ahead."
9   });
10 }
11 }
```

The terminal at the bottom shows the output of the API call:

```
✓ Compiled / in 3.6s (466 modules)
✓ Compiled in 679ms (227 modules)
✓ Compiled /favicon.ico in 472ms (267 modules)
o Compiling /api ...
✓ Compiled /api in 731ms (285 modules)
{
  username: 'anu',
  password: '223'
}
```

Rest Output on ThunderClient

This is the output when we create an API using REST.

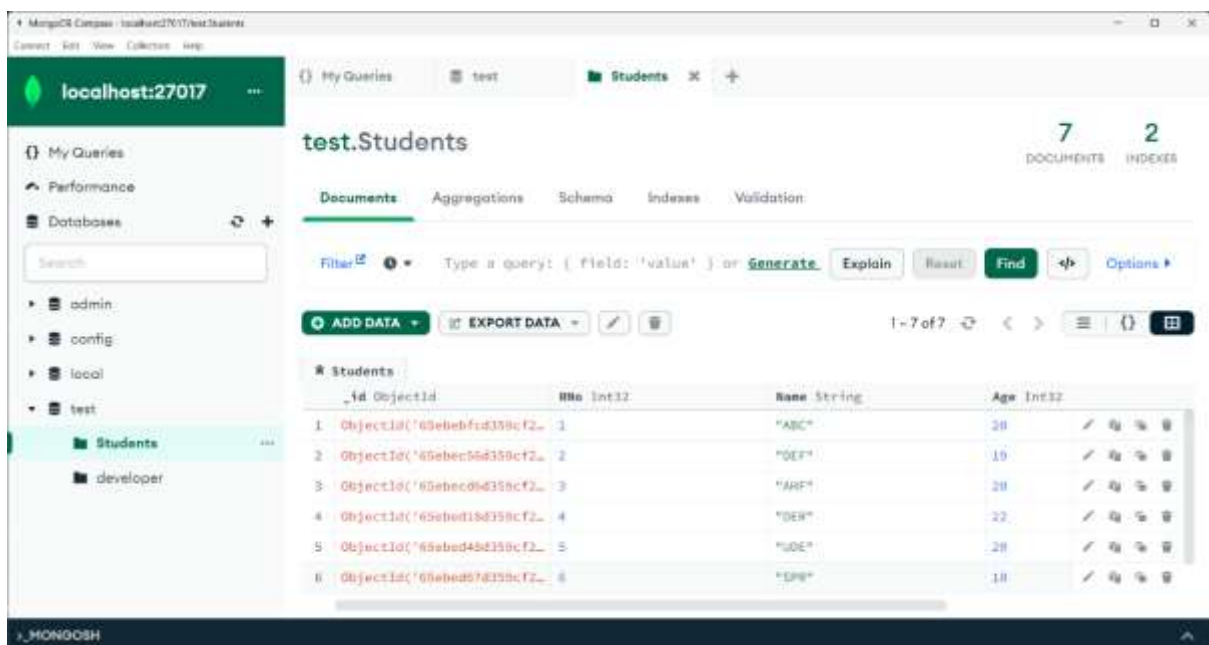

DataBase Creation

1st we created a database named test

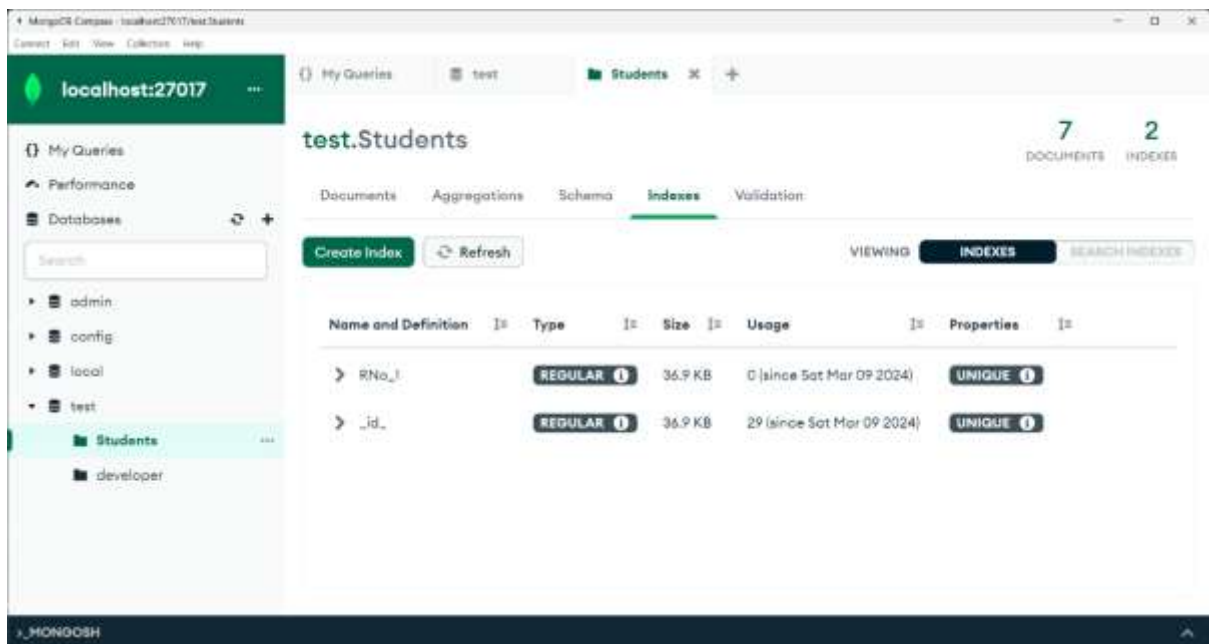

In that test we created a collection named Students

And finally by using ADD DATA , we added data of the students like rno, name, age.

Indexing Creation

As rno is the unique attribute through which we identify a student uniquely. So, here I created an index based on Rno. And assigned unique key to it.

Indexing usage

As we gave Rno as unique, If we try to insert a duplicate document that is existed it shows an error like..duplicate collection.
